

ABSTRACT OF THE DISCLOSURE

There is provided such a communication terminal that a caller can determine whether forwarding is to be allowed. A telephone terminal according to the invention forwards telephone communication that has income via a call processing signal input device, to a forwarding destination previously set in a substitute communication destination storage area. The telephone terminal receives a forwarding start or prohibition order signal from a sending source of telephone communication via the call processing signal input device, and starts or prohibits forwarding of the telephone communication. In addition, when the telephone terminal has received a call of telephone communication via the call processing signal input device, the telephone terminal transmits information stored in a forwarding information storage area to the sending source before the telephone communication shifts to a talking state, and executes forwarding of the communication after the notice has been transmitted.
